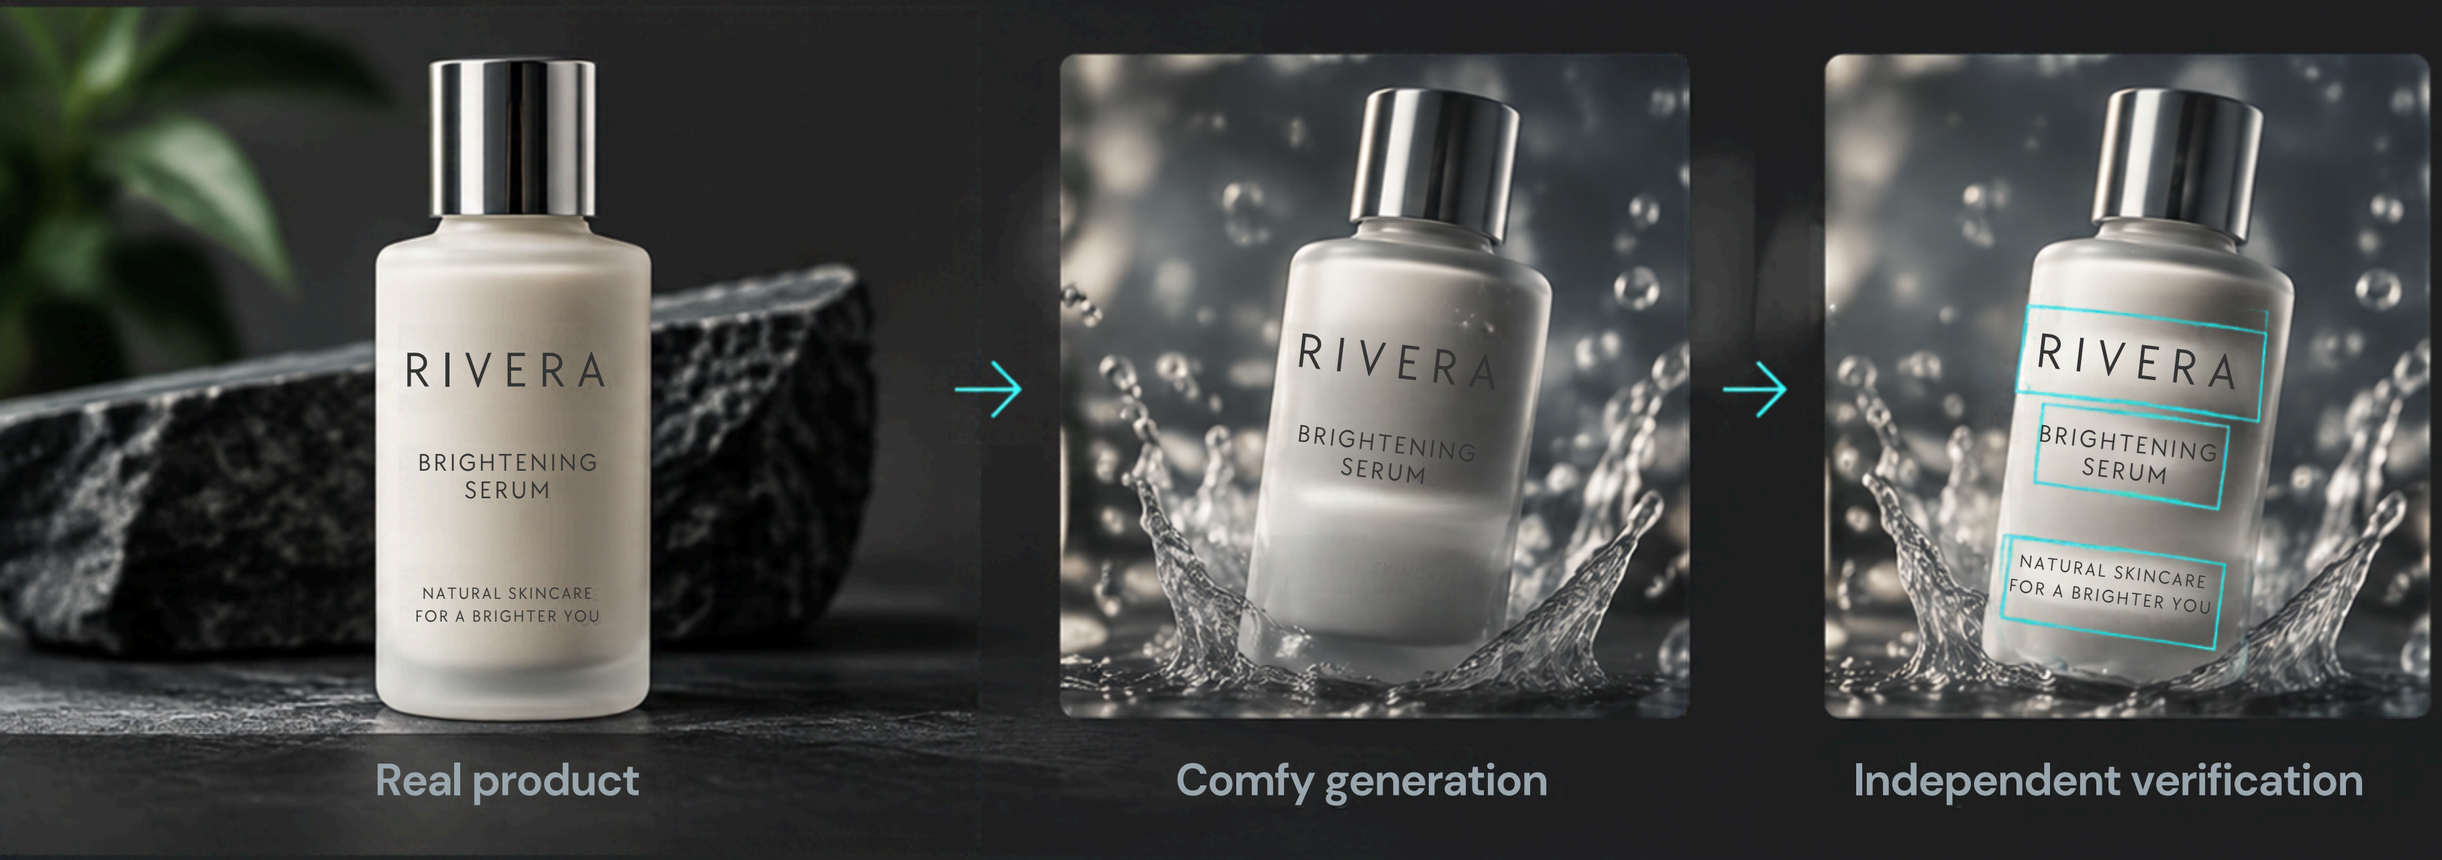
AI can generate the ad.
But did it preserve the product?



Real product

Comfy generation

Independent verification

BrandProof independently verifies product-label fidelity in AI-generated video.

A prompt can request fidelity.
It cannot prove it.

Generation: an AI model creates a compelling video, but may distort label text or product details.

The missing layer is independent verification.
We need to inspect the output, not trust the instruction.

From a product photo to evidence you can inspect.

1. **Upload:**
   provide the original product photo
   and exact brand name and label text.

2. **Generate:**
   select a scene and generate a real video through a
   Comfy Cloud LTX-2.3 workflow.

3. **Verify:**
   sample frames throughout the returned
   MP4 and run Tesseract.js 7 OCR against the
   visible label.

4. **Inspect:**
   review detected text, confidence,
   bounding boxes, frame-byframe evidence,
   the verdict, and a downloadable JSON report.

Verification: BrandProof examines actual video frames and reports the evidence it finds.

PASS / REVIEW / FAIL

Comfy generates the video. BrandProof independently examines the returned MP4 and lets the judge inspect the evidence behind the verdict.

Real Comfy generation.
Independent, frame-level verification.

The architecture matters: generation and verification are separate.
OCR reads the actual frames; the expected text is used only as the comparison target.

Server-side Worker proxy

- Receives generation requests
- Keeps the Comfy Cloud API key server-side
- Submits the bundled LTX-2.3 workflow through Comfy Cloud API v2
- Polls the job
- Downloads the real generated MP4

Comfy Cloud

- Executes the workflow
- Returns the video for verification

Verification pipeline inside the browser

Sample frames

HTMLVideoElement seeks to 12 evenly spaced timestamps by detailf, covering 4x-36% of the clip. Canvas extracts frames.

Preprocess and locate label

Frames are upscaled and a label crop is automatically located. Original, grayscale, contrast, and adaptive-threshold variants are tested.

OCR and post-process

Tesseract.jt 7 performs OCR in the browser. Duplicate OCR detections are merged and crop coordinates mapped to fullframe coordinates.

Compare and aggregate

Recognized text is compared with the user-entered expected label. Frame-level evidence is aggregated into a verdict and JSON report.

Results in browser

The UI displays evidence and permits JSON report download.

OCR is not part of the generation model and Comfy does not certify the result.

Every verdict has evidence behind it.

Frame evidence

OCR evidence

RIVIERA	0.99	OCR pass
BRIGHTENING SERUM	0.98	OCR pass
NATURAL SKINCARE FOR A BRIGHTER YOU	0.96	OCR pass

Text comparison

Recognized	natural skincare for a brighter you
Normalized	NATURAL SKINCARE FOR A BRIGHTER YOU
Levensstein similarity	0.98
Containment	Yes

Token states

RIVIERA	MATCH
BRIGHTENING	MATCH
SERUM	NEAR
NATURAL SKINCARE	MISSING
FOR A BRIGHTER YOU	UNREADABLE

Auditability

We show what was detected, where it was detected, and how the verdict was reached. When evidence is ambiguous, we say so rather than manufacturing certainty.

PASS:
critical checks meet configured readability, frame-coverage, and confidence requirements.

REVIEW:
evidence is insufficient or ambiguous; missing or unreadable text alone is not automatically a mismatch.

FAIL:
a critical check demonstrably fails under the configured rules.

OCR confirms text was read; it does not prove full product authenticity or exact 3D shape fidelity.

Generate creatively.
Verify independently.

Built with Comfy:
a real Comfy Cloud LTX-2.3 generation workflow.

Evidence-driven:
independent inspection of actual video frames.

Auditable:
frame-level OCR evidence and an exportable report.

Comfy creates the video.
BrandProof checks what survived.

We don't just generate the ad. We check whether the product survived the generation.

The opportunity is not just generating more AI video. It is making generated content easier to verify and trust.
